1. Introduction

1.1 Purpose and Scope

This manual describes the Admin console of AutoVaultLK, the web-based marketplace for second-hand vehicles in Sri Lanka. It is intended for administrators, who verify dealers, manage accounts, monitor the import of inventories, produce reports and maintain the dictionary of vehicle makes. The functions used by buyers and dealers are described in separate manuals.

1.2 System Overview

AutoVaultLK was developed as Project 11 by Group 25 of the Department of Computer Science and Engineering, University of Moratuwa. Its functional requirements are recorded in the Software Requirements Specification [2], and its design is described in the Software Architecture Document [3]. The Admin console is a part of the same web application as the public site, but it is reached from a separate sign-in page and is available only to accounts that hold the administrator role.

1.3 Responsibilities and Conventions

An administrator is responsible for the trustworthiness of the marketplace. Dealers are approved only after their documents have been examined, accounts are deactivated when necessary, and every such action is recorded in an audit log so that it can be traced afterwards, in line with accepted practice for security log management [4]. Because the role carries wide powers, the password must never be shared, and the console must always be closed with **Sign out** on a shared computer. The names of buttons, tabs and fields are printed in bold as they appear on screen, and all data in the screen captures are sample data.

2. Access and Layout

2.1 Signing In

Administrator accounts cannot be registered through the public pages. The first administrator is created by the platform owner when the system is installed. The sign-in page, shown in Fig. 1, is not linked from the public site, and its address is supplied by the platform owner. The account is entered with its email address and password, and **Sign in** opens the dashboard. Any other user who tries to open the console is returned to the sign-in page.

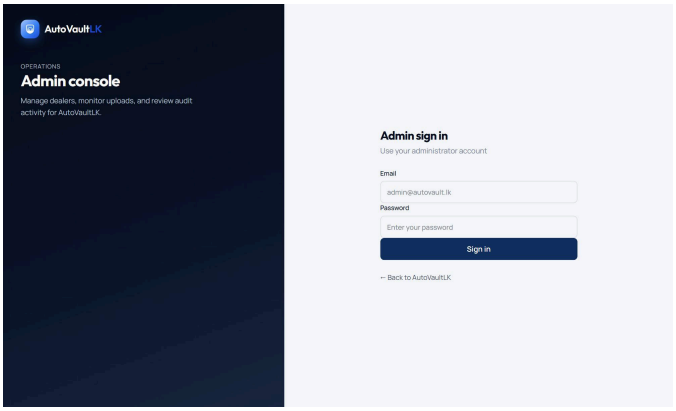

Fig. 1. Administrator sign-in page.

2.2 Sidebar

The sidebar on the left gives access to six pages. **Dashboard** reports the health of the marketplace, **Users** manages accounts and dealer applications, **Uploads** monitors bulk imports, **Reports** produces summaries for a period, **Audit logs** records administrative actions, and **New vehicle types** maintains the dictionary of makes. The signed-in email address and a **Sign out** button are at the foot of the sidebar.

3. Dashboard

3.1 Headline Figures and Trends

The dashboard opens after sign-in and answers two questions, namely whether the marketplace is healthy and whether anything is waiting for attention. The upper part, shown in Fig. 2, displays four headline figures: the live listings, the total users, the registered dealers and the pending approvals. Three charts show the last 30 days of new listings, new users and submitted uploads, and each notes the busiest day and the total for the period.

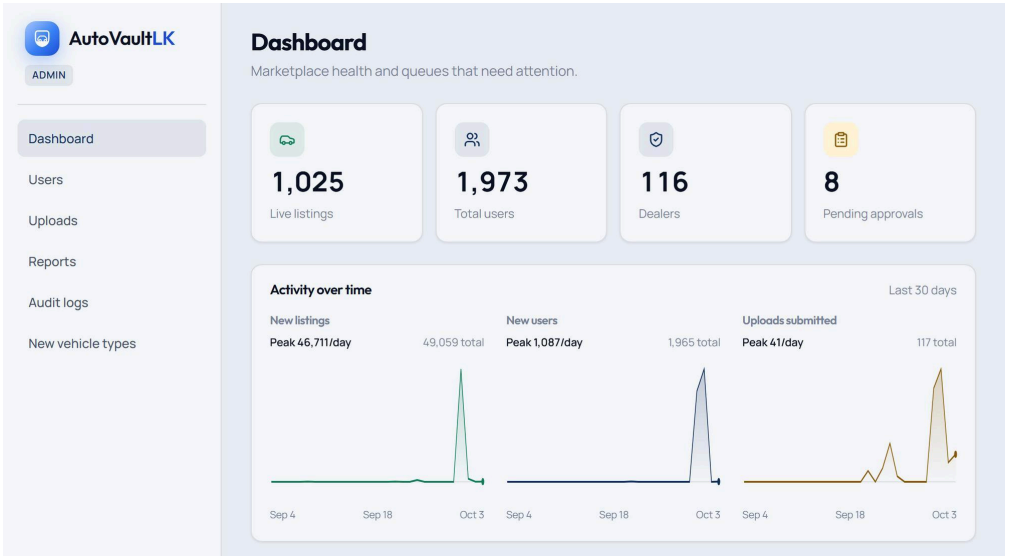

Fig. 2. Administrator dashboard: headline figures and activity over time.

3.2 Breakdowns and Recent Activity

The lower part, shown in Fig. 3, breaks the listings down by status and shows their composition, and it counts the uploads that are processing, completed, failed or partial. It also reports how many notification emails were delivered, the upload success rate and the share of upload rows that were accepted in full. A list of recent activity shows the latest administrative actions, and the **View all** links open the Uploads and Audit logs pages.

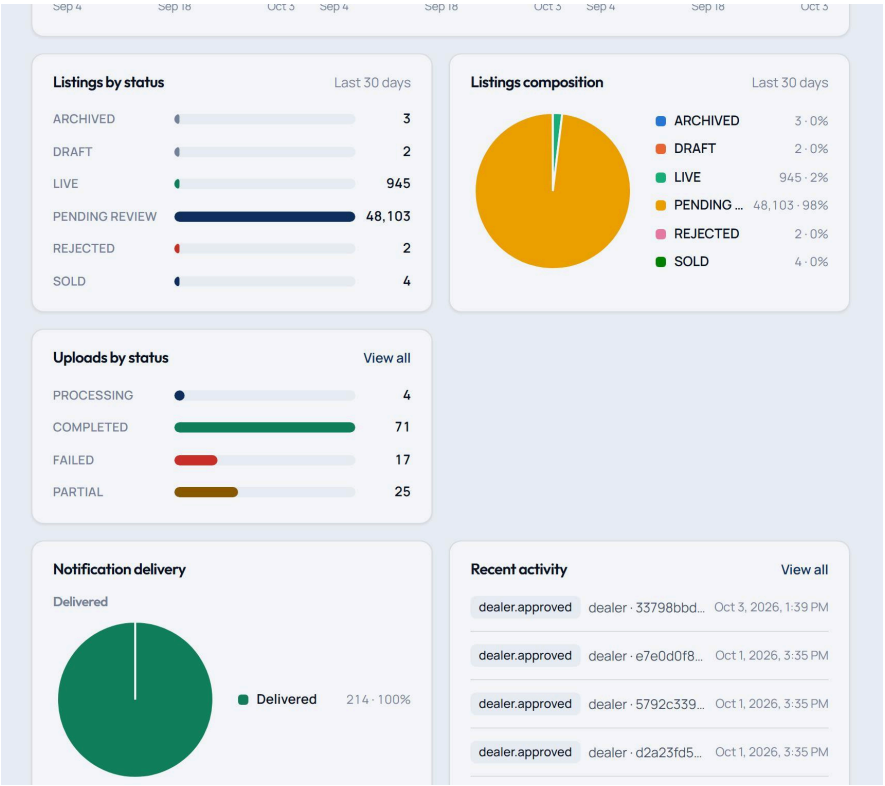

Fig. 3. Lower part of the dashboard: breakdowns, notification delivery and recent activity.

4. Users and Dealer Approval

4.1 Users Page

The **Users** page, shown in Fig. 4, lists every account with its name, email address, role, status, dealer details and joining date. The status is active when the account can sign in and inactive when it has been deactivated or has not been confirmed. For dealers, the company name, city and verification status are shown, together with a **View document** link that opens the certificate uploaded at registration. The page has two tabs. **All users** shows every account, and **Pending dealers** restricts the list to the applications that await a decision.

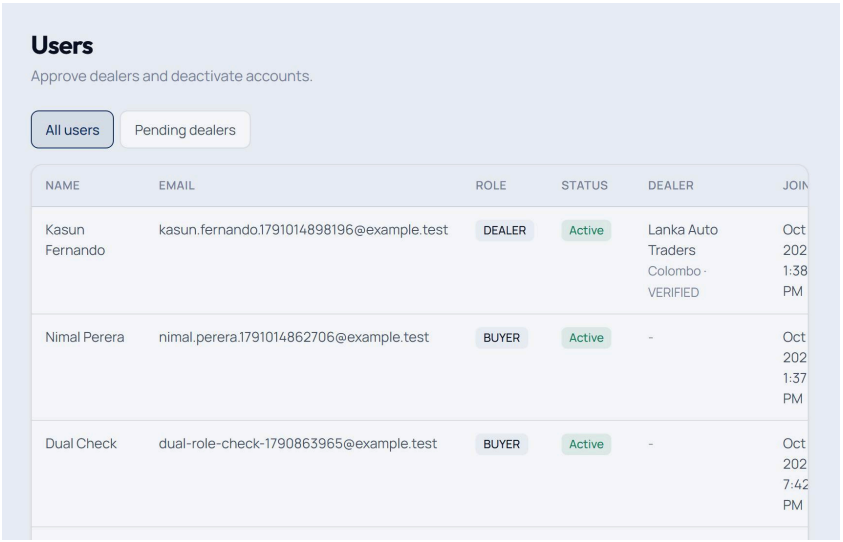

Fig. 4. Users page listing all accounts.

4.2 Approving and Rejecting Dealers

Applications are processed in the **Pending dealers** tab, shown in Fig. 5, following the procedure in Fig. 6. The administrator opens the tab, inspects the certificate of a business dealer or the identification details of an individual dealer, and then decides. **Approve** verifies the dealer, who gains access to the full Dealer Portal, and a **Verified** badge then appears on the dealer's listings. **Reject** asks for a reason. The reason is shown to the dealer on the account, so it should state clearly what must be corrected, for example that a certificate is unreadable. The dealer may then correct the details and resubmit, which returns the application to the pending list.

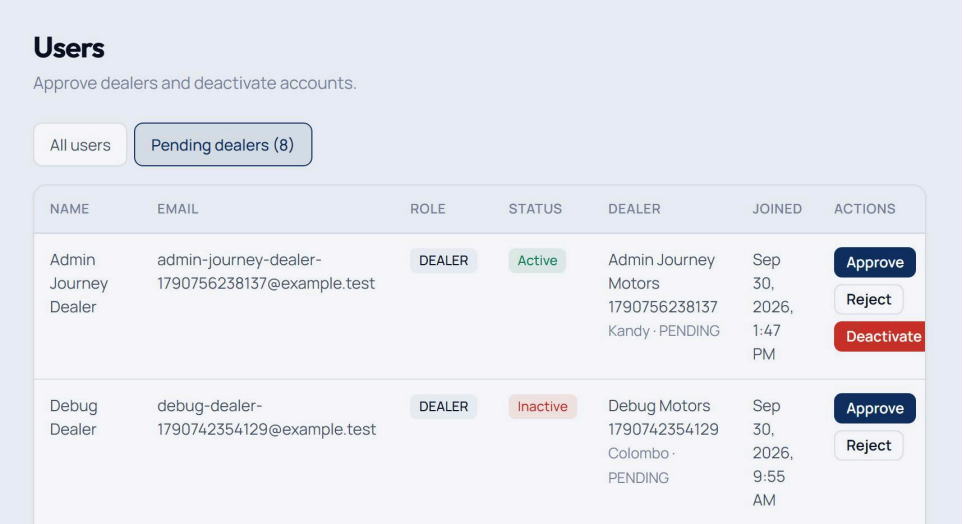

Fig. 5. Pending dealers tab of the Users page.

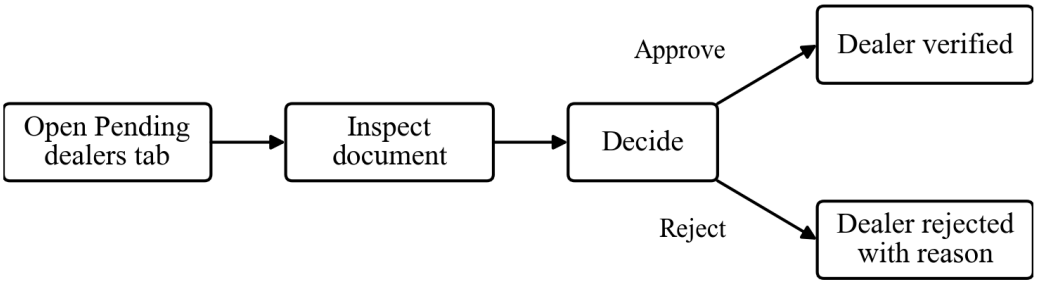

Fig. 6. Procedure for reviewing a dealer application.

4.3 Deactivating Accounts

Deactivate is selected on the row of an account and confirmed in the prompt that follows. The account becomes inactive, and its owner can no longer sign in. Administrators cannot deactivate their own account or that of another administrator, and the own account is marked **You**. Approvals, rejections and deactivations are all written to the audit log.

5. Upload Monitoring

The **Uploads** page, shown in Fig. 7, lists the bulk upload jobs of all dealers, newest first, so that administrators can see whether dealers are succeeding and can assist those who are not.

A status filter restricts the list to pending, processing, completed, failed or partial jobs. Each row gives the file name and job identifier, the status, the dealer identifier, the number of valid records out of the total, and the time of submission. Completed jobs are marked green, jobs in progress amber, and failed or partial jobs red.

Fig. 7. Uploads page listing bulk upload jobs of all dealers.

For a job that has invalid rows, **View reasons** opens the report that the dealer also sees, shown in Fig. 8. It lists the row number, the problem and the data that were received, for example a registration number that is already listed. This report allows the cause of a failed import to be identified without access to the dealer's files. **Hide reasons** closes the report.

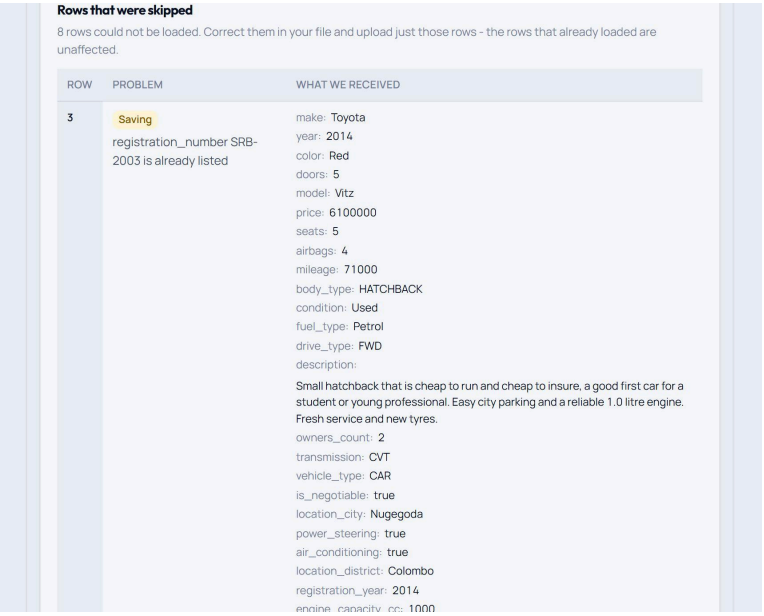

Fig. 8. Skipped-row report opened with View reasons.

6. Reports

The **Reports** page produces a summary for a chosen period, formatted so that it can be saved as a document. The default period is the last 30 days. After the **From** and **To** dates are set, **Run report** displays the key figures shown in Fig. 9, which are the accounts created in the period, the upload jobs run, the records processed and the job error and partial rates. Charts then show the listings by status, the upload rows that were accepted or rejected, and the outcomes of the upload jobs, as in Fig. 10. **Download PDF** opens the print dialog of the browser, from which the report is saved as a PDF file.

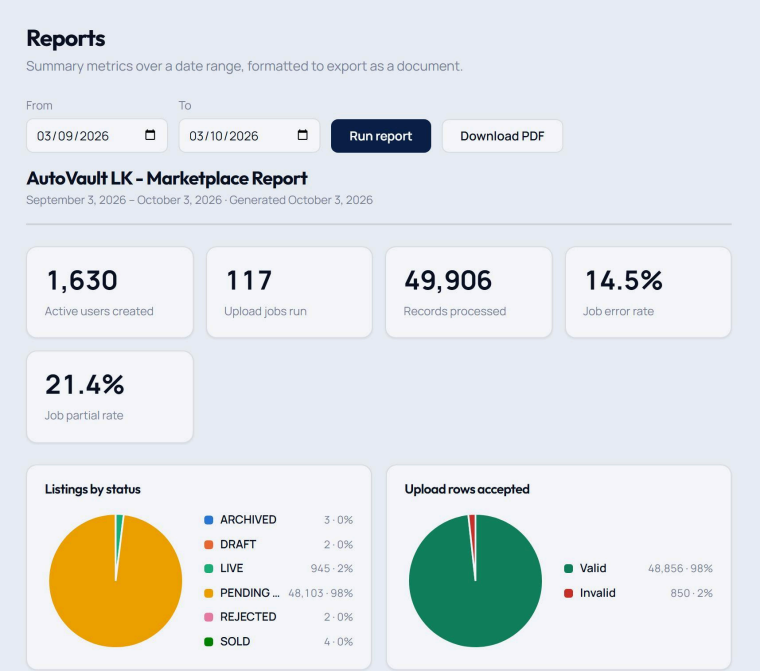

Fig. 9. Reports page with the key figures for a selected period.

Fig. 10. Charts of listing status, row acceptance and job outcomes in the report.

7. Audit Logs

The **Audit logs** page, shown in Fig. 11, presents the latest 200 events that match the search, with the time, action, entity, acting administrator and network address. The search can be restricted by action, entity type, actor identifier and date range, and a filter that is left empty is ignored. For example, an entity type of "dealer" lists the dealer approvals together with the administrator who carried them out. The log is intended for accountability and investigation, and it cannot be edited from the console.

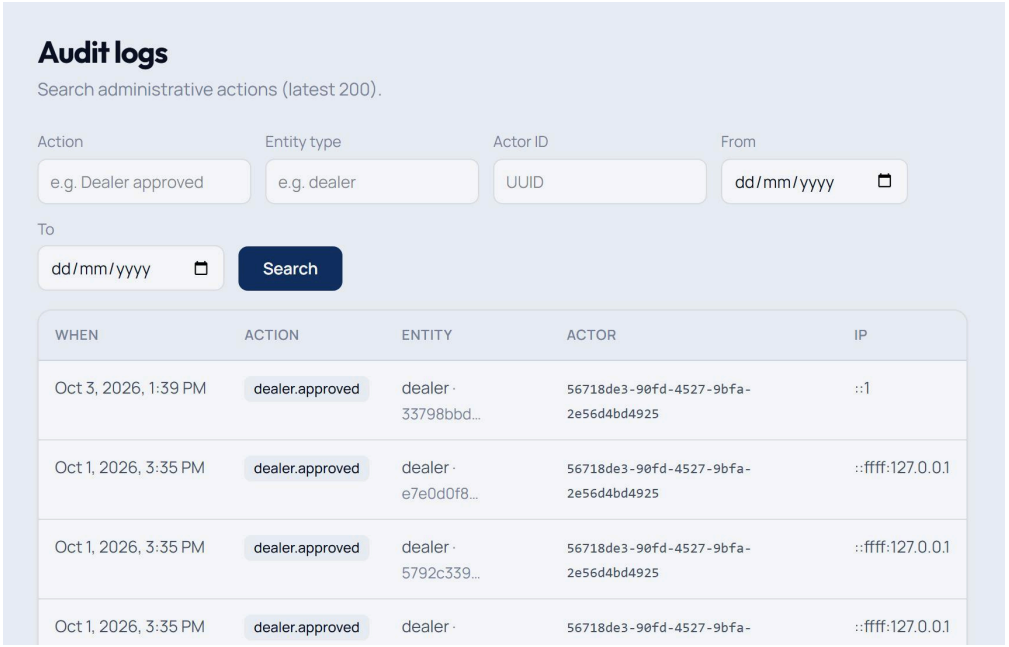

Fig. 11. Audit logs page.

8. Vehicle Dictionary

The platform recognises makes and models from a built-in dictionary. When an uploaded file contains a make that cannot be recognised, the affected rows are skipped, and the unrecognised text is collected on the **New vehicle types** page, shown in Fig. 12. Each entry shows the make as typed, the number of rows and dealers in which it occurred, the closest make in the dictionary with a similarity score, and sample rows that show it in context.

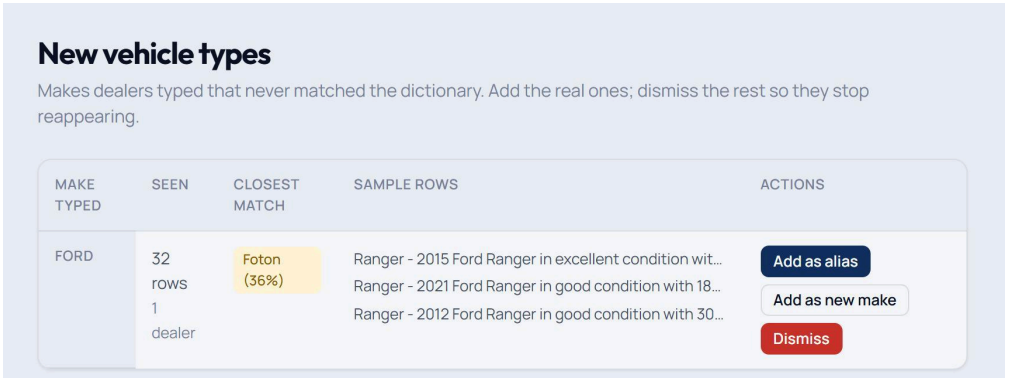

Fig. 12. New vehicle types page showing an unrecognised make.

Each entry is resolved by one of the three decisions in Fig. 13. **Add as alias** treats the text as a misspelling of the closest make after confirmation, so that later uploads with that spelling resolve to the existing make automatically. **Add as new make** adds a genuinely new make to

the dictionary under a name that can be edited, so that later uploads are accepted. **Dismiss** removes noise such as typing errors and prevents the entry from reappearing. A make that recurs across several dealers is more likely to be genuine than a single dealer's one-off error.

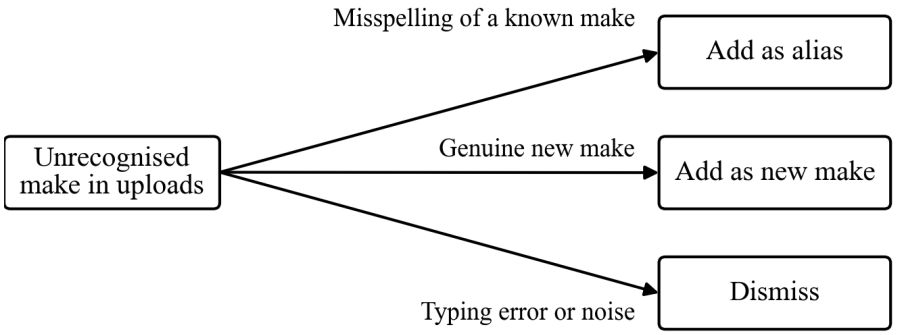

Fig. 13. Decisions available for an unrecognised make.

9. Good Practice and Troubleshooting

Pending applications should be reviewed regularly, because a dealer cannot list vehicles until a decision is made. The pending count on the dashboard shows when the queue is growing. When a dealer reports a failed upload, the Uploads page should be consulted first, since the skipped-row report usually identifies the cause, which is most often a misspelled make, a missing mandatory value or a duplicate registration number. If a legitimate make is repeatedly rejected, it should be added through the dictionary, and the dealer should then upload the affected rows again. A rejection should always include an actionable reason, and an account should be deactivated only when there is a clear cause, since the action prevents the owner from signing in. A session that expires is renewed by signing in again.
